

STATEMENT OF INTEREST

# EthicHawks Forensic Telemetry Engine

*AI-Driven Forensic Telemetry for Real-Time Institutional Governance and NHI Accreditation Readiness*

1

## PROJECT TITLE

EthicHawks: AI-Driven Forensic Telemetry for Real-Time Institutional Governance and NHI Accreditation Readiness.

2

## INNOVATOR / ENTITY

EthicHawks (Pty) Ltd

3

## TECHNOLOGY DESCRIPTION

EthicHawks is a specialised digital health governance solution that integrates clinical, procurement, and human capital data into a unified telemetry engine. Utilising the proprietary Wilbur Method™, the system employs a multi-agent AI pipeline to map the structural geometry of healthcare institutions. It detects “Institutional Malice”—systemic patterns of operational bypass, service suppression, and financial maladministration—in real-time.

Unlike reactive audits, EthicHawks provides proactive, data-driven alerts, ensuring that healthcare providers maintain audit-readiness for the NHI’s stringent Phase Two accreditation requirements.

4

## TECHNOLOGY READINESS LEVEL (TRL)

**Currently at TRL 5 — Technology Validation in Relevant Environment.** The API architecture is functional, the logic models for “Real-Time Red Flags” are operational, and the system has produced a validated Parliamentary Forensic Evidence Bundle as a proof-of-concept.

5

## MARKET NEED & IMPACT

The South African health sector faces a critical shift with the NHI Act (2023). Public and private providers currently lack tools to monitor systemic risks, relying on retrospective audits that identify financial loss only after the damage is irreversible. EthicHawks fills this gap by acting as an early-warning system for systemic collapse.

- **Social Impact:** Improves patient care outcomes by detecting service suppression before it translates into clinical harm.

- **Economic Impact:** Protects state assets by preventing fraudulent procurement bypasses, directly supporting the NHI Fund's integrity.

**6****INNOVATION & INTELLECTUAL PROPERTY**

The core innovation lies in the Wilbur Method™, which translates clinical governance standards into mathematical risk vectors. The system utilises SHA-256 cryptographic hashing to ensure that all ingested telemetry data remains immutable, creating a tamper-evident audit trail suitable for regulatory and legal scrutiny. All data processing is strictly POPIA-compliant, employing advanced tokenisation to anonymise patient and personnel identifiers at the point of ingestion.

**7****COMMERCIALISATION STRATEGY**

Our strategy involves a three-phase deployment:

- **Phase 1 — Pilot:** 60-day “Shadow Run” within a selected public/private facility to validate predictive accuracy against historical incident data.
- **Phase 2 — Scale:** Offering EthicHawks as a mandatory “NHI Accreditation Readiness” service to contracted healthcare providers.
- **Phase 3 — Regulatory Integration:** Partnering with oversight bodies (including the SIU) to deploy EthicHawks as a standardised forensic telemetry layer for state-funded health assets.

**8****PROJECT TEAM CAPABILITY**

The project is led by a Specialist Registered Nurse (NQF Level 8) with 16 years of clinical governance experience and a CISA-accredited Compliance Practitioner. The development team combines domain-specific forensic knowledge with advanced software engineering (Python/FastAPI) to ensure the solution is both technically robust and clinically grounded.
